SYN.: bawl, bellow, clamor, cry, cry out, ejaculate, exclaim, roar, scream, shout, shriek, vociferate, yell. To *call* is to send out the voice in order to attract another's attention, either by word or by inarticulate utterance. Animals *call* their mates, or their young; a man *calls* his dog, his horse, etc. The sense is extended to include summons by bell, or any signal. To *cry* is to *call* loudly or eagerly, in alarm, distress, or excitement. In the most common usage, however, to *cry* is simply to express grief or pain by weeping or sobbing. To *shout* is to *call* with the fullest volume of sustained voice; to *scream* is to utter a shriller cry; to *shriek* or to *yell* refers to that which is louder and wilder still. We *shout* words; in *screaming, shrieking,* or *yelling* there is often no attempt at articulation. To *bawl* is to utter senseless, noisy cries, as of a child in pain or anger. *Bellow* and *roar* are applied to the utterances of animals, and only contemptuously to those of persons. To *clamor* is to utter with noisy iteration; it applies also to the confused cries of a multitude. To *vociferate* is commonly applied to loud and excited speech where there is little besides the exertion of voice. In *exclaiming,* the utterance may not be strikingly, tho somewhat, above the ordinary tone and pitch; we may *exclaim* by mere interjections, or by connected words, but always by some articulate utterance. To *ejaculate* is to throw out brief, disconnected, but coherent utterances of joy, regret, and especially of appeal, petition, prayer; the use of such devotional utterances has received the special name of "ejaculatory prayer." To *cry out* is to give forth a louder and more excited utterance than in *exclaiming* or *calling;* one often *exclaims* with sudden joy as well as sorrow; if he *cries out,* it is oftener in grief or agony. In the most common colloquial usage, to *cry* is to express grief or pain by weeping or sobbing. One may *exclaim, cry out,* or *ejaculate* with no thought of others' presence; when he *calls,* it is to attract another's attention. See CHOOSE; CONVOKE; EXCLAIM; INVITE.— PREP.: call *to* a passer-by; call *after* one who is departing or fleeing; call *on* or *upon* a friend, or *at* his house; call *on* or *upon* one *for* aid or service; call *upon* the country *for* troops; he is called *by* the name of Lincoln, *after* the great emancipator; his integrity has never been called *in* question.

SYN.: abolish, annul, blot out, cross off or out, discharge, efface, erase, expunge, make void, nullify, obliterate, quash, remove, repeal, rescind, revoke, rub off or out, scratch out, vacate. *Cancel*, *efface*, *erase*, *expunge*, and *obliterate*, have as their first meaning the removal of written characters or other forms of record. To *cancel* is, literally, to make a lattice by cross-lines, exactly our English *cross out*; to *efface* is to *rub off*, smooth away the face, as of an inscription; to *erase* is to *scratch out*, commonly for the purpose of writing something else in the same space; to *expunge* is to punch out with some sharp instrument, so as to show that the words are no longer part of the writing; to *obliterate* is to cover over or remove, as a letter, as was done by reversing the Roman stylus, and *rubbing out* with the rounded end what had been written with the point on the waxen tablet. What has been *canceled*, *erased*, *expunged*, may perhaps still be traced; what is *obliterated* is gone forever, as if it had never been. In many establishments, when a debt is *discharged* by payment, the record is *canceled*. The figurative use of the words keeps close to this primary sense. Compare synonyms for ABOLISH.— ANT.: approve, confirm, contract, enact, enforce, establish, maintain, perpetuate, record, reenact, sustain, uphold, write.— **canceled type** (*Print.*), a type the face of which is cast with a line across it, as some figures in arithmetics.

Syn.: aboveboard, artless, fair, frank, guileless, honest, impartial, ingenuous, innocent, naive, open, simple, sincere, straightforward, transparent, truthful. A *candid* statement is meant to be just to all parties; a *fair* statement is really so. *Fair* is applied to the conduct; *candid* is not; as, *fair* treatment, "a *fair* field, and no favor." One who is *frank* has a fearless and unconstrained truthfulness. *Honest* and *ingenuous* unite in expressing contempt for deceit. On the other hand, *artless, guileless, naive, simple,* and *unsophisticated* express the goodness which comes from want of the knowledge or thought of evil. As truth is not always agreeable or timely, *candid* and *frank* have often an objectionable sense; "to be *candid* with you," "to be perfectly *frank,*" are regarded as sure preludes to something disagreeable. *Open* and *unreserved* may imply unstudied truthfulness or defiant recklessness; as, *open* admiration, *open* robbery. There may be *transparent* integrity or *transparent* fraud. *Sincere* applies to the feelings, as being all that one's words would imply.— Ant.: adroit, artful, crafty, cunning, deceitful, designing, knowing, maneuvering, sharp, shrewd, sly, subtle, tricky, wily.— Prep.: candid *in* debate; candid *to* or *toward* opponents: candid *with* friend or foe; to be candid *about* or *in regard to* the matter.

Whatever things are destined for this use, destined to supply productive labor with these various prerequisites, are capital." . . . President Francis A. Syn.: anxiety, attention, caution, charge, circumspection, concern, direction, forethought, heed, management, oversight, precaution, prudence, solicitude, trouble, wariness, watchfulness, worry. *Care* concerns what we possess; *anxiety,* often, what we do not; riches bring many *cares; poverty* brings many *anxieties. Care* signifies also watchful *attention,* in view of possible harm; as, "This side up with *care;*" "Take *care* of yourself;" or, as a sharp warning, "Take *care!*" *Caution* has a sense of possible harm and risk only to be escaped, if at all, by careful deliberation and observation. *Care* inclines to the positive, *caution* to the negative; *care* is shown in doing, *caution* largely in not doing. *Precaution* is allied with *care, prudence* with *caution;* a man rides a dangerous horse with *care; caution* will keep him from mounting the horse; *precaution* looks to the saddle-girths, bit and bridle, and all that may make the rider secure. *Circumspection* is watchful observation and calculation, but without the timidity implied in *caution. Concern* denotes a serious interest, milder than *anxiety;* as, *concern* for the safety of a ship at sea. *Heed* implies *attention* without disquiet; it is now largely displaced by *attention* and *care. Solicitude* involves especially the element of desire, not expressed in *anxiety,* and of hopefulness, not implied in *care.* A parent feels constant *solicitude* for his children's welfare, *anxiety* as to dangers that threaten it, with *care* to guard against them. *Watchfulness* recognizes the possibility of danger, *wariness* the probability. A man who is not influenced by *caution* to keep out of danger may display great *wariness* in the midst of it. *Care* has also the sense of responsibility, with possible control, as expressed in *charge, management, oversight;* as, these children are under my *care;* send the money to me in *care* of the firm. [< LL. *categoria,* < Gr. *katēgoria,* accusation, assertion, < *katēgoreō,* assert, < *kata,* against, + *agoreuō,* declaim, < *agora,* assembly.] SYN.: see CLASS; LIST.— **categories of Aristotle,** the ten categories — substance, quantity, quality, relation, place, time, posture, possession, action, passion.— **categories of Hegel,** the categories as arranged by this philosopher in a system of triads, on the basis of the assumption that the evolution of reality corresponds to a rational development, or progress in the triumph of spirit over the material which it molds. Other thinkers have adopted this triadic arrangement in a different way; while still others have proposed a dyadic, or even with Schelling a quadrate scheme of the categories.— **categories of Kant,** those formulated by this great German philosopher, who, dissatisfied with the haphazard way in which, as he thought, Aristotle had derived the categories, proposed an exhaustive and final selection and division of them on the basis of the twelve possible forms of all judgment. He therefore prepared a table with four classes and three in each class, as follows: (1) *quantity,* embracing unity, plurality, and totality; (2) *quality,* embracing reality, negation, limitation; (3) *relation,* embracing substance and attribute, cause and effect, action and reaction; (4) *modality,* embracing possibility, actuality, and necessity. With Kant, therefore, a category means one of the constitutional forms of the functioning of intellect in all kinds of judgment. Since Kant, the word *category* has come to be used more loosely for any fundamental conception.

— **cau'cus-er,** *n.* An advocate of the caucus system in politics; a participant in a caucus.

cau'cus, *n.* **1.** [U. S.] A private meeting of members of a political party to select candidates or concert measures for adoption by the party. **2.** Specifically: (1) A meeting of local voters to nominate for local offices, elect delegates to a nominating convention, or the like; a primary. (2) A meeting of representative members of a party, as in a legislative body, to determine on a policy or on special measures which shall be unitedly supported by the party membership in the deliberations or actions of the body. **3.** Any meeting of similar character or for similar purposes, held by business men, as railway officials. **4.** [Eng.] A political committee or other body in charge of a local canvass or election: often used in contempt or reproach: a misuse.

It was to this supposed imitation of the American political 'machine' that Lord Beaconsfield gave the name *caucus*, and the name came to be used, not in the American sense of a meeting, but of a closely disciplined system of party organization.
Encyc. Brit. 11th ed., vol. v, p. 556.

5. [Austral.] (1) A cabal, as of the Labor party in the federal or state parliaments to determine its vote on any issue before Parliament. (2) Hence, the Labor party itself: an opposition name.

Dr. William Gordon, author of the *History of the American Revolution*, writing in 1774, said: "More than fifty years ago, Mr. Samuel Adams's father, and twenty others, one or two from the north end of the town, where all ship business is carried on, used to meet and make a *caucus*, and lay their plan for introducing certain persons into places of trust and power." John Pickering, in his *Vocabulary of Words Peculiar to the United States* (Boston, 1816), assumed that the word was a corruption of *calkers*, and that *calkers' meetings* was meant, and he found that old residents of Boston and Salem had the same impression. The existence of a *caucus club* in Boston before the Revolution is attested in the quotation from John Adams, and Dr. J. H. Trumbull suggested in 1872 that the word might be derived from the Algonkin *cau'-cau-as'-u*, one who advises, as Indian names were not infrequently adopted, in New England, for political societies and clubs.

This day learned that the *Caucus Club* meets, at certain times in the garret of Tom Dawes, the Adjutant of the Boston Regiment.

4. In a comprehensive sense, all the circumstances (*powers, occasions, actions, and conditions*) necessary for an event and necessarily followed by it; the entire antecedent of an event; the fundamental and philosophical conception of cause; in general, whatever in reality stands in relations analogous to those between a necessitated conclusion and its antecedent grounds. See CAUSALITY.

The modern conceptions of the nature of cause have chiefly divided into two groups, either that which follows Kant, who regarded cause as an *a priori* form of the understanding, or that which agrees with Hume in denying all knowledge of causal efficiency and regarding the conception of cause as simply the impression made by a uniform sequence of phenomena.

It is generally assumed that when two things are spoken of as cause and effect that their relation is a necessary one, or, in other words, that given the cause the effect must follow. . . . In so far as causation is regarded as necessary connexion, it can form no part of a purely empirical theory of existence. The senses can say only that in all observed cases B follows A and this does not establish necessary connexion.

Syn.: actor, agent, antecedent, author, causality, causation, condition, creator, designer, former, fountain, occasion, origin, originator, power, precedent, reason, source, spring. The efficient material, or substantial *cause*, that which makes anything to be or to be done, is the common meaning of the word, as in the saying "There is no effect without a *cause.*" Every man instinctively recognizes himself acting through will as the *cause* of his own actions. The *Creator* is the Great First *Cause* of all things. A *condition* is something that necessarily precedes a result, but does not produce it. An *antecedent* simply precedes a result, with or without any agency in producing it; as, Monday is the invariable *antecedent* of Tuesday, but not the *cause* of it. The direct antonym of *cause* is *effect*, while that of *antecedent* is *consequent.* An *occasion* is some event which brings a *cause* into action at a particular moment; gravitation and heat are the *causes* of an avalanche; the steep incline of the mountain-side is a necessary *condition*, and the shout of the traveler may be the *occasion* of its fall. *Causality* is the doctrine or principle, *causation* the action or working of causes. See ANTECEDENT; CASE; DESIGN; PURPOSE; REASON. — Ant.: consequence, creation, development, effect, end, event, fruit, issue, outgrowth, product, result. — Prep.: the cause *of* the disaster; cause *for* interference.

This division is architectonic and may be illustrated by the process of building, which involves (*a*) a plan, (*b*) some kind of material, (*c*) workmen, and (*d*) a completed and serviceable structure. — **centrifugal c.** (*Biol.*), the interaction of one cell of a multicellular organism with the rest of the cells regarded as the determining factor of its differentiation and development. — **centripetal c.** (*Biol.*), the physical environment in which a cell or an organism lives regarded as a causative factor in the cell-development. Its ability to fast for long periods gave rise to the belief that it fed on air. The chameleons are mostly Madagascan and African, but *Chamæleo vulgaris* extends into Europe and Asia.

Champagne-bottle and -glass.

Into this [champagne] district are imported every year, from almost every wine-producing portion of France, large quantities of white wine, none of it having the peculiar virtue of *champagne,* which causes the latter to effervesce of itself. Several of the important houses of Reims and Epernay use this imported wine by blending it with the juice of the real champagne grapes and adding to it what is known as 'liqueur de champagne' to insure a characteristic fermentation and effervescence.
The New York Times, Feb. 12, '11, § 5, p. 1, col. 3.

Champagne effervesces through liberation of carbon-dioxid gas generated during the fermentation in bottle, or, in spurious varieties, forced in. See WINE. (2) A wine made elsewhere in imitation of it. (3) Loosely, any sparkling wine.

Good *champagne* is usually of a pale straw colour, but with nothing of a yellow tinge about it. Rose-coloured *champagnes* are simply tinted with a small quantity of deep red wine. The perfection of *champagne* is derived from the quality of the wine used, and in the careful and judicious selection of the grapes to make the original blend. EDWARD R. (2) Since the judicature act of 1873, one of the five divisions of the High Court of Justice.

The Court of Chancery, which was developed subsequently to the establishment of the English courts of law, dates back to the reign of Edward the Confessor, and was so called because it was presided over by the Lord Chancellor. In the early days of the common law, all petitions addressed to the king passed through the chancellor's hands, and in time these became so numerous that in 1280 under Edward I. an ordinance was issued empowering the chancellor *to deal with most of them. Later, in the reign of* Edward III., matters which were of grace were referred directly to the chancellor for settlement and thus the practise of obtaining relief in this manner assumed the character of a judicial proceeding, and the chancellor's office, or chancery, became known as the Court of the Chancellor or the Court of Chancery.

To *turn* is a popular word for *change* in any sense short of the meaning of *exchange,* being often equivalent to *alter, convert, transform, transmute,* etc. We *modify* or *qualify* a statement which might seem too strong; we *modify* it by some limitation, *qualify* it by some addition. — Ant.: abide, bide, continue, endure, hold, keep, persist, remain, retain, stay.— Prep.: to change a home toilet *for* a street dress; to change *from* a caterpillar *to* or *into* a butterfly; to change clothes *with* a beggar.— **to change about. 1.** To leave one's party or side, and join another. **2.** To be inconstant or fickle.— **to c. a horse** (*Manège*), to turn a horse's head from one side to the other. **to c. hand‡.**— **to c. arms,** to shift the musket or rifle from one shoulder to the other.— **to c. color,** to blush; sometimes, to turn pale.— **to c. front. 1.** *Mil.* To face a different way; alter the direction of a line of attack or defense. **2.** Figuratively, to alter one's attitude on a subject or question.— **to c. hands,** to pass into a new ownership; change owners.— **to c. one's mind,** to alter one's opinion or purpose.— **to c. one's note** or **tune** [Colloq.], to alter one's manner of speaking.— **to c. sides,** to desert one's party.

The steps by which 'escheat' has yielded '*cheat*,' . . . are interesting to trace. The 'escheatour' was an officer in each county who took notice of fines and forfeitures technically called 'escheats' on the royal manors, which had fallen in to the Crown, and certified these to the Exchequer. But he had commonly such a reputation for fraud and extortion in the execution of his office, that by an only too natural transition the 'escheatour' passed into the 'cheater,' and 'escheat' into '*cheat.*'

It is played with 24 pieces, 12 on each side, arranged and moved upon a board divided into 64 squares. The object of the game and the aim of each player are to capture all his opponent's pieces by moving over each with an adjacent one of his own into an opposite vacant square, or so to block them with his own that they can not be moved. If a player neglects to take an opposing piece when in a position to do so, his adversary *has the option of compelling him to take it, of removing* from the board the piece that should have jumped, or of allowing the play to stand. When a piece reaches the last row on the opponent's side of the board, it becomes a *king*, and can be moved either forward or backward. The position of the board and pieces at the commencement of the game is shown in the illustration. The black squares, on which the plays are made, are numbered from 1 to 32, as indicated, the numbers always commencing at the side of the board occupied by the black men. The moves are indicated as follows: 14–18, a move from square 14 to square 18; 9–18, a jump from square 9 to square 18, involving the capture of an opposing piece; 16-30, a double jump, with the capture of two opposing pieces, etc.

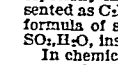
It is *pure* or *theoretical*, and *applied* or *practical*. *Theoretical chemistry* has to do with the laws governing chemical action, while *applied chemistry* treats of the application and economic relation of chemistry to the arts. According to its special application, applied chemistry may be considered as *agricultural, analytical, medical, metallurgical, pharmaceutical, physical, physiological, sanitary*, etc.

In chemistry, the elements are represented by accepted abbreviations, called *symbols*, each of which indicates a single atom of the element. (See table under ELEMENT.) When more than one atom is to be represented, figures are placed to the right of the symbol either above or below the line; thus, O^2, or O_2. A molecule representing a compound is indicated by a series of such symbols called a *formula*; thus, alcohol has for its formula C_2H_6O, which shows that a molecule of this substance contains two atoms of carbon, six of hydrogen, and one of oxygen. To indicate more than one molecule, various expedients are used; thus, each of the groups of symbols 2HCl, 2(HCl), and $(HCl)_2$, stands for two molecules of hydrochloric acid.

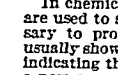
The atoms of a group within a molecule are frequently separated from others by means of periods or commas, especially in complex formulas; thus, alcohol may be represented as $C_2H_5.HO$ or C_2H_5,HO, instead of C_2H_6O, and the formula of sulfuric acid was formerly written $H_2O.SO_2$, or SO_2,H_2O, instead of H_2SO_4.

In chemical reactions, the signs + (plus) and − (minus) are used to show that the formulas so connected are necessary to produce a desired reaction, and the results are usually shown as immediately following the sign = (equals), indicating that the original groups have reacted to produce a new compound; thus, the action of sulfuric acid on zinc, formerly indicated by the symbols $Zn + SO_2.H_2O = ZnO.SO_2 + H_2$, and now by $Zn + H_2SO_4 = ZnSO_4 + H_2$, shows in the latter case that one molecule of sulfuric acid acting on one molecule of zinc yields one molecule of zinc sulfate and one of hydrogen.

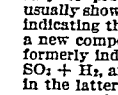
Valence, or combining power, may be represented by prime-marks or Roman numerals; thus, Ca″ or Ca^{II} shows that calcium is bivalent; Bi‴ or Bi^{III} that bismuth is trivalent. In graphic formulas straight dashes, each of which signifies a single unit of affinity, and which, when they connect two symbols, are called *bonds*, serve to indicate *chemical union or saturation; thus, H — indicates univalent hydrogen, O =, or O —, or O = indicates bivalent oxygen, Bi≡* indicates trivalent bismuth, and so on. (The position of the lines is determined merely by convenience.) By means of these graphic formulas the constitution of very complex bodies may be expressed, especially in organic chemistry:



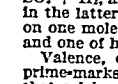
thus, methane, or marsh-gas, CH_4, or C(—H)(—H)(—H)(—H) is frequently



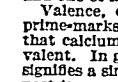
represented H — C(—H)(—H) — H, and any one or more of the four



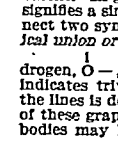
hydrogen atoms may be substituted by a monovalent atom



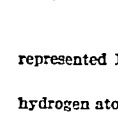
or group; thus, Cl — C(—H)(—H) — Cl or $CH.Cl_3$ represents chloro-



form. The so-called benzene ring,



sometimes condensed into  , represents C_6H_6. Correspondingly, in this any one of the hydrogen atoms may be substituted by a monovalent group, or two hydrogen atoms by a bivalent group, etc.; thus,



is $C_6H_5(NH_2)$, amidobenzene, or aniline.

In thermochemistry a superior c (c), signifying calories, is used in exothermic reactions, to represent the heat-units evolved in the combination of the elements; thus, $H_2 + O = H_2O + 59258^c$. When the reaction is endothermic, a minus-sign is used before the number of calories, thus, $C + H + N = CNH - 37700^c$.

SYN: cheer, comfort, encourage, entertain, foster, harbor, hold dear, nourish, nurse, nurture, protect, shelter, value. To *cherish* is both to hold dear and to treat as dear. Mere unexpressed esteem would not be *cherishing*. In the marriage vow, "to love, honor, and *cherish*," the word *cherish* implies all that each can do by love and tenderness for the welfare and happiness of the other, as by support, protection, care in sickness, comfort in sorrow, sympathy, and help of every kind. To *nurse* is to tend the helpless or feeble, as infants, or the sick or wounded. To *nourish* is strictly to sustain and build up by food; to *nurture* includes careful mental and spiritual training, with something of love and tenderness; to *foster* is simply to maintain and care for, to bring up; a foster-child will be *nourished*, but may not be as tenderly *nurtured* or as lovingly *cherished* as if one's own. In the figurative sense, the opinion one *cherishes* he holds, not with mere cold conviction, but with loving devotion. Compare CARESS. — ANT: see synonyms for ABANDON. — **cher'ish-a-bl(e)**, *a.* — **cher'ish-er**, *n.* — **cher'ish-ing-ly**, *adv.* — **cher'ish-ment**, *n.* The act of cherishing; hence, encouragement; nourishment.

chess¹, 1 ches; 2 chĕs, *n.* A game played by two or more persons on a checkered board divided into 64 squares alternately light and dark, with 16 men or pieces on each side, arranged at the beginning as shown in the illustration. The term *piece* in its restricted sense designates each of the eight men in the first row, namely, a *king*, a *queen*, two *bishops*, two *knights*, and two *castles* or *rooks*, of which the king, queen, and castle are known as **major pieces** and the bishop and knight as **minor pieces.** The second row contains eight *pawns.* The opposing pieces are distinguished by their color, those on one side being white and those on the other either black or red, now usually the former. The rows of squares running perpendicularly, or from one player toward the other as they sit at the board, are termed *files*, those running horizontally, *rows.* The squares are numbered from the players along the files, those in each file taking the name of the major piece occupying the first square; thus, the square on which the king stands is called the *king's square*, the next in front *king's 2*, the next *king's 3*, and so on. As the board is numbered from one side for one player and from the other side for the other, it will be noted that black *king's 5* will be the white *king's 4*, and so on. The values of the pieces are graded according to their mobility, which is the measure

Chess-board.

The pieces (indicated by their respective equivalents in chess notation) are arranged as at the beginning of a game, the conventional symbol for each piece being set opposite the square it normally occupies, or, in the case of the pawns, at either end of the pawn row.

of their power for attack or defense, the queen being the most powerful, the rook next, etc. The aim of each player is to checkmate the opponent's king.

At the beginning of a game each major piece has a pawn on the square immediately in front of it, as shown by the abbreviations in the illustration, such pawn being known by the name of that piece before which it is set, as *queen's rook's pawn.* The major pieces themselves, when in play, are known from the side of the board on which they originally stood, as *king's rook*, *queen's bishop*, etc. To commence a game the pieces must be moved alternately, white always moving first save when the odds of a pawn are given. Certain initiative moves and replies have been analyzed and classified. See list of openings below. For the moves, see the names of pieces in the vocabulary, also CHECK, CHECKMATE, and KNIGHT'S TOUR. Chess is one of the few games of pure skill. It is played in one form or another in all parts of the civilized world, and comes down from so great antiquity that its origin is lost in obscurity. It was known in the Orient for centuries before it penetrated to Europe.

> They dancen, and they play at *chess* and tables.
> CHAUCER *C. T., Franklin's Tale* l. 172.

The following system of notation is used for the purpose of recording games as played between experts and also for the setting forth and solution of chess problems. Compare NOTATION, *n.*

B = bishop. K = king. Kt = knight. R = rook (castle). Q = queen. P = pawn. e. p. = en passant. ch = check. x = takes. O–O = castles on the king's side. O–O–O = castles on the queen's side. sq. = square. ~ = to; as, P–K4 = pawn to king's 4. S = knight in some systems, being taken from the German *springer.*

A native or naturalized inhabitant of China; the people of China; specifically, a member or members of the Mongoloid race who form the bulk of the people of China; also, the race collectively or ethically, as distinguished from the Manchus, etc. 2. The monosyllabic language of China, forming an independent stock.

The Mandarin (*Kuan hua,* official language) is the literary dialect. It has neither alphabet, inflection, declension, nor conjugation, and consists of 400 to 500 spoken monosyllables, which have different meanings according to intonation and connection, or syntactical "position." Altho in some dialects there are found eight intonations, pitches, or "tones," the Mandarin recognizes only five. In addition to "position" and "tone," "help" words, which Chinese scholars term "empty," corresponding to our prepositions and auxiliaries, are employed. While the written language is uniform throughout China, there are many dialects, mutually unintelligible and differing among themselves somewhat as do the Romance languages of southern Europe. Besides the Mandarin, which dominates nearly four-fifths of China proper, the chief dialects are those of Canton, Swatow, Amoy, Foochow, Wenchow, and Ningpo. Time, number, gender, etc., are expressed by using two or more words. In the written language there are more than 40,000 characters, each representing one sense of a word. The characters are written or printed in vertical columns, beginning at the right-hand top corner of the page.

Chlorophyl is formed in the exposed parts of plants, coloring certain definite portions of the protoplasm, the coloring-substance proper being the chlorophyl-pigment, and the protoplasmic bodies thus colored the chlorophyl-bodies or -grains. The function of chlorophyl consists in the absorption and decomposition of carbon-dioxid gas, resulting in the evolution of oxygen and the formation of new organic substance. The action takes place only in sunlight. Chlorophyl is obtained as a bright-green residue from an alcoholic extract of leaves. Fungi are without chlorophyl, and certain animals, as some infusorians, possess it. [< F. *chlorophylle*, < Gr. *chlōros* (see CHLOR-) + *phyllon*, leaf.]

Chlorophyll appears to be intimately connected with the conversion of the radiant energy of the sun's light into the chemical energy by which plants build up their structure from the elements of carbon dioxid and water. Technically, *chlorophyll* is utilized to a small extent as a coloring matter in cookery, and in the manufacture of liqueurs.

Syn.: cull, elect, pick, pick out, prefer, select. *Prefer* indicates a state of desire and approval; *choose*, an act of will. Aside from theology, *elect* is popularly confined to the political sense; as, a free people *elect* their own rulers. *Cull*, from the Latin *colligere*, commonly means to collect, as well as to *select*.
